

Somaloy®

Guidelines for packing components

Somaloy is a brittle material and should be handled with care. The components should be packed separately in tight fitting packing material with damping ability.

Guidelines

The fit should be tight enough to prevent components from moving but soft enough to avoid damage (to the components).

- » Use a sturdy container and packing material to prevent components from breaking during transport.
- » Confirm that the components are separated and secured in the container.
- » **IMPORTANT!** Fill the container completely to ensure that components cannot move.
